## FLIPPERS

Electrical flipper operation is shown in Figure 1. All contacts are shown in attract mode positions. During game play, the Game Over Relay (Q)\* energizes and closes the Q contact (dashed lines). When a player presses the flipper button, the 24 VDC voltage generates a current that passes through the end-of-stroke switch and the low resistance windings of the flipper coil (direction indicated by dark line). The plunger is pulled into the coil core with the end-of-stroke switch contacts opening approximately 1/16" before full plunger stroke. The 24 VDC is now applied to the full winding, increasing the current (direction indicated by dashed line). This protects the coil from burn-out when the flippers stay energized. Poor flipper power or a high burn-out rate for coils may result if the end-of-stroke switch is not adjusted as mentioned above.

When a tilt condition occurs, the Tilt relay\* is energized. Subsequently,

the T contact opens, deactivating the flippers.

Flipper coils and their ratings are listed on page 4. The IN4004 diode across the flipper coil suppresses any transient voltage spikes developed when the flipper button switch opens.

### FLIPPER REPLACEMENT

(Refer to Figure II)

1. Lift playfield and secure with bracket.
2. Loosen both socket head cap screws with a 5/32" allen wrench.
3. Slowly pull flipper shaft assembly away from flipper unit and playboard.
4. Unscrew pan head screw holding flipper to flipper shaft.
5. Pull flipper from shaft.
6. Remove rubber ring from defective flipper and install on a new flipper.
7. Align and press new

8. flipper down on the flipper shaft pin.
9. Screw and tighten pan head screw to flipper.
10. From the playfield top, insert the flipper shaft assembly through the flipper unit.
11. Align and hold flipper on playfield for proper position.
12. Tighten both cap screws.

### FLIPPER COIL REPLACEMENT

1. Lift playfield and secure with bracket.
2. Unsolder the wires from the three coil terminals. Note the wire-to-terminal connections of the end-of-stroke switch, the diode, the ground wire (GRN/YEL 54), and the wire leading to the flipper button. See Figure II illustration.

3. Remove the coil stop bracket by unscrewing the two hex screws with a 1/4" hex nut driver or a regular screwdriver.
4. Pull the coil away from the plunger assembly.
5. Pull the plastic sleeve out of the bad coil and insert it into the new coil.
6. Slide the new coil onto the plunger assembly, insuring that the spring washers slide over the plastic sleeve.
7. Replace and screw the coil stop bracket into place.
8. Solder the wires and diode to their proper terminals.

Figure III is a flipper assembly occasionally used when flippers are positioned in the upper portion of the playfield where lack of space does not permit the flipper assembly of Figure II. The end-of-stroke switch is screwed to the playboard and positioned so that the flipper lever arm opens its contacts during flipper activation.

Normally, all coils are powered by +24 VDC.

## GOTTLIEB COIL CHART

In the past, many operators have commented that Gottlieb does not provide enough information on its coils. Hopefully, the following coil information chart will aid all operators with quick and proper coil replacement.
