## 2048-word×8-bit UV Erasable and Electrically Programmable Only Memory

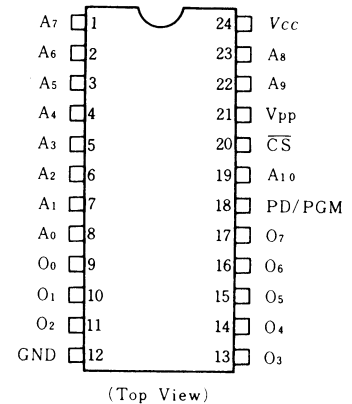

The HN462716 is a 2048 word by 8 bit erasable and electrically programmable ROMs. This device is packaged in a 24-pin, dual-in-line package with transparent lid. The transparent lid allows the user to expose the chip to ultraviolet light to erase the bit pattern, whereby a new pattern can then be written into the device.

- Single Power Supply . . . . . +5V ±5%;
- Simple Programming . . . . . Program Voltage: +25V DC  
Programs with One 50ms Pulse
- Static . . . . . No Clocks Required
- Inputs and Outputs TTL Compatible During Both Read and Program Modes
- Fully Decoded-on Chip Address Decode
- Access Time . . . . . 450ns Max.
- Low Power Dissipation . . . . . 55mW Max. Active Power  
213mW Max. Standby Power
- Three State Output . . . . . OR- Tie Capability
- Interchangeable with Intel 2716

● **PROGRAMMING WAVEFORMS**

### ● ERASE

Erasure of HN462716 is performed by exposure to ultraviolet light with a wavelength of 2537Å, and all the output data are changed to "1" after this erasure procedure.

The minimum integrated dose (i.e., UV intensity x exposure time) for erasure is  $15W \cdot \text{sec}/\text{cm}^2$ .

## ■ DEVICE OPERATION

### ● READ MODE

Dataout is available 450 ns ( $t_{ACC}$ ) from addresses with  $\overline{OE}$  low or 120 ns ( $t_{OE}$ ) from  $\overline{OE}$  with addresses stable.

### ● DESELECT MODE

The outputs may be OR-tied together with the other HN462716s. When HN462716s are deselected, the  $\overline{OE}$  inputs must be at high TTL level.

### ● POWER DOWN MODE

Power down is achieved with  $\overline{CE}$  high TTL level. In this mode the outputs are in a high impedance state.

### ● PROGRAMMING

Initially, and after each erasure, all bits of the HN462716 are in the "high" state (Output High). Data is introduced by selectively programming "low" into the desired bit locations. In the programming mode,  $V_{pp}$  power supply is at 25V and  $\overline{OE}$  input is at high TTL level. Data to be programmed are presented 8-bits in parallel, to the data output lines (O1 to O8).

The addresses and inputs are at TTL levels.

After the address and data setup, a 50 ms, active high program pulse is applied to the  $\overline{CE}$  input. The  $\overline{CE}$  is at TTL level.

The HN462716 must not be programmed with a DC signal applied to the  $\overline{CE}$  input.

### ● PROGRAM VERIFY

The HN462716 has a program verify mode. A verify should be performed on the programmed bits to determine that they were correctly programmed. In this mode  $V_{pp}$  is at 25V.

### ● PROGRAM INHIBIT

Programming of multiple HN462716s in parallel with different data is easily accomplished by using this mode. Except for  $\overline{CE}$ , all like inputs of the parallel HN462716s may be common.

A TTL program pulse applied to 0 HN462716's  $\overline{CE}$  input will program that HN462716. A low level  $\overline{CE}$  inhibits the other HN462716s from being programmed.
