Notice Regarding Non-ATARI Parts

─ WARNING —

Use of non-ATARI parts or modifications of any ATARI® game circuitry may adversely affect the safety of your game, and may cause injury to you and your players.

You may void the game warranty (printed on the inside back cover of this manual) if you do any of the following:

- Substitute non-ATARI parts in the game.
- Modify or alter any circuits in the game by using kits or parts not supplied by Atari.

NOTE

This equipment generates, uses, and can radiate radio frequency energy and if not installed and used in accordance with the instruction manual, may cause interference to radio communications. It has been tested and found to comply with the limits for a Class A computing device pursuant to Subpart J of Part 15 of Federal Communications Commission (FCC) Rules, which are designed to provide reasonable protection against such interference when operated in a commercial environment. Operation of this equipment in a residential area or modification to this equipment is likely to cause interference in which case the user, at his own expense, will be required to take whatever measures may be required to correct the interference. If you suspect interference from an ATARI® game at your location, check the following:

- All green ground wires in the game are properly connected as shown in the game wiring diagram.
- The power cord is properly plugged into a grounded three-wire outlet.
- The game printed-circuit boards (PCB) are properly installed within the Electromagnetic Interference (EMI) cage.
- The EMI Shield PCB is properly installed and connected in series with the game PCB harness.
- All filter capacitors required on the EMI Shield PCB are properly soldered in place.

If you are still unable to solve the interference problem, please contact ATARI Customer Service. See the inside front cover of this manual for service in your area.

Safety Summary

The following safety precautions apply to all game operators and service personnel. Specific warnings and cautions will be found throughout this manual where they apply.

▲ WARNINGS **▲**

Properly Ground the Game. Players may receive an electrical shock if this game is not properly grounded! To avoid electrical shock, do not plug in the game until it has been inspected and properly grounded. This game should only be plugged into a grounded 3-wire outlet. If you have only a 2-wire outlet, we recommend you hire a licensed electrician to install a grounded outlet. Players may receive an electrical shock if the control panel is not properly grounded! After servicing any parts on the panel, check that the grounding clip is firmly secured to the metal tab on the inside of the control panel. Only then should you lock up the game.

AC Power Connection. Before connecting the game to the AC power source, verify that the proper voltage-selection plug is installed on the game's power supply.

Disconnect Power During Repairs. To avoid electrical shock, disconnect the game from the AC power source before removing or repairing any part of the game. When removing or repairing the video display, extra precautions must be taken to avoid electical shock because high voltages may exist within the display circuitry and cathode-ray tube (CRT) even after power has been disconnected. Do not touch internal parts of the display with your hands or metal objects! Always discharge the high voltage from the CRT before servicing this area of the game. To discharge the CRT: Attach one end of a large, well-insulated, 20-kV jumper to ground. Momentarily touch the free end of the grounded jumper to the anode by sliding it under the anode cap. Wait two minutes and discharge the anode again.

Use Only ATARI Parts. To maintain the safety integrity of your ATARI game, do not use non-ATARI parts when repairing the game. Use of non-ATARI parts or other modifications to the game circuitry may adversely affect the safety of your game, and injure you or your players.

Handle Fluorescent Tube and CRT With Care. If you drop a fluorescent tube or CRT and it breaks, it may implode! Shattered glass can fly six feet or more from the implosion.

Use the Proper Fuses. To avoid electrical shock, use replacement fuses which are specified in the parts list for this game. Replacement fuses must match those replaced in fuse type, voltage rating, and current rating. In addition, the fuse cover must be in place during game operation.

CAUTION

Properly Attach All Connectors. Make sure that the connectors on each printed-circuit board (PCB) are properly plugged in. Note that they are keyed to fit only one way. If they do not slip on easily, do not force them. A reversed connector may damage your game and void the warranty.

Set Up

Shock Hazard

To avoid electrical shock, do not plug in the game until it has been inspected and properly set up for the line voltage in your area.

Do not touch internal parts of the display with your hands or metal objects!

How to Use This Manual

This manual, written for game operators and service technicians, describes your new Atari game.

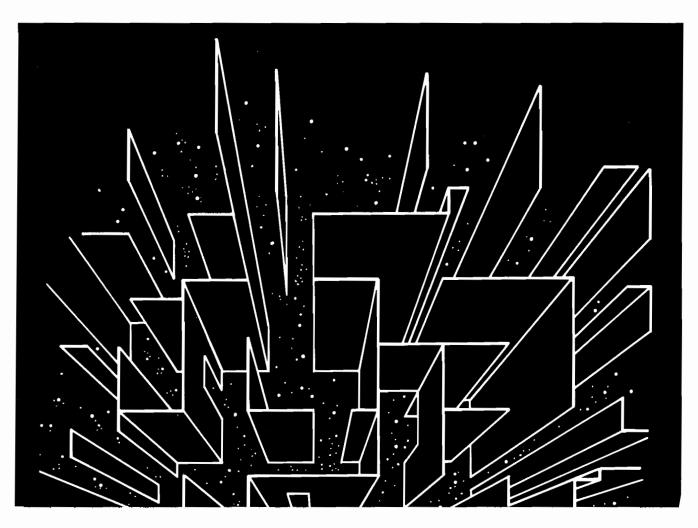

Chapter 1 contains a game overview, game specifications, inspection procedures, voltage plug and fuse information, switch locations, and option information.

Chapter 2 contains self-test procedures.

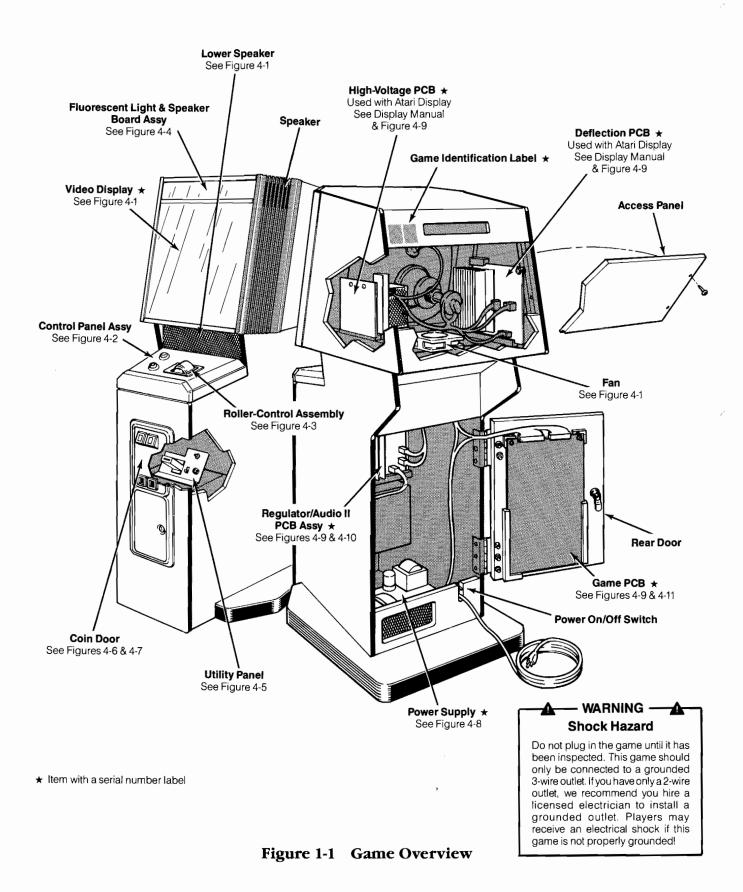

Chapter 3 contains maintenance and repair procedures.

Chapter 4 contains illustrated parts lists. Notes in this chapter refer you to other places in the manual for more detailed information.

Schematic diagrams of the game circuitry are included as a supplement to this manual.

Set Up Major Havoc

Game Overview

You are Major Havoc, leader of a brave band of clones. All from one, one from all, fighting for humanity. . . .

Eons ago the evil Vaxxian Empire overran the galaxy. Most of your ancestors were enslaved and taken to the Vaxxian homeworld. Only a few scientists escaped.

The small band of scientists cloned you, Major Havoc, to fly your Catastrofighter through a wormhole in space, leading your clone army against the dreaded Vaxxian robots to free your people by destroying the enemy reactor.

New Features

High-Tech Game Cabinet. A new video arcade game cabinet design delivers high visibility and increased player attraction.

Roller Control. The backlit roller control provides left-to-right and right-to-left directional movement.

Multi-Layer Printed-Circuit Board. This state-of-theart design printed-circuit board (PCB) provides low system noise with high system reliability.

Game Within a Game. Action occurs in the lower right corner of the TACTICAL SCAN. Breakout® can be played for a few seconds before the actual Major Havoc game play starts. Earn a bonus life here!

Dual FIRE/JUMP Button. This dual-action button allows Major Havoc to jump in the maze sequence and to fire at enemy robots in the space wave.

Add-A-Coin. This feature permits you to start a new Major Havoc game at the level where you last saw the TACTICAL SCAN in your previous game play.

Secret Warp Code. The code feature rewards you for short game times as it advances to deep levels in game play. Use the roller control to dial in secret code numbers during the TACTICAL-SCAN wave.

All major parts of the cabinet are illustrated in Figure 1-1.

Installation Requirements

Table 1-1 describes the physical, electrical, and environmental specifications of the game.

Table 1-1 Installation Specifications

Characteristic	Requirement
Power Consumption	200 W
Temperature	0° to $+32^{\circ}$ C ($+32^{\circ}$ to $+100^{\circ}$ F)
Humidity	Not to exceed 95% relative
Line Voltage	100 to 240 VAC
Width	64.1 cm (25.25 in.)
Depth	80.3 cm (31.6 in.)
Height	170.8 cm (67.25 in.)

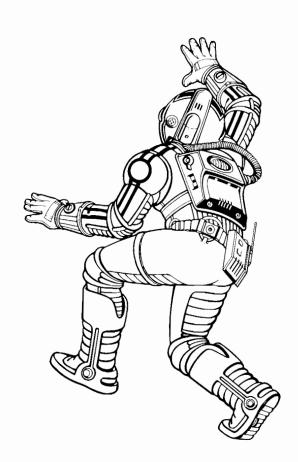

__

- WARNING -

To avoid electrical shock, do not plug in the game until you have inspected the game and selected the appropriate line voltage plug.

Do not touch internal parts of the display with your hands or with metal objects!

Inspecting the Game

Please inspect your game carefully to ensure that it was delivered to you in good condition.

- Examine the exterior of the game cabinet for dents, chips, or broken parts.
- Remove the screws from the rear access panel. Unlock and open this panel and the coin door. Inspect the interior of the game as follows:
 - a. Ensure that all plug-in connectors (on the game harnesses) are firmly plugged in. Replug any connectors found unplugged. Do not force connectors together. The connectors are keyed so they only fit in the proper orientation. A reversed edge connector may damage a printed-circuit board (PCB) and will void your warranty.
 - Ensure that all plug-in integrated circuits on each
 PCB are firmly plugged into their sockets.
 - c. Remove the tie-wrap that secures the coiled power cord inside the cabinet. Inspect the power cord for any cuts or dents in the insulation. Repair or replace it as required. Place the square strain-relief plate in the wood slot at the bottom of the rear panel opening.

- d. Inspect the power supply. Make sure the fuse block cover is mounted in place. Check that the green ground wire is connected.
- e. Inspect other major subassemblies, such as the control panel, video display, EMI cage, and each PCB. Make sure they are mounted securely and that the green ground wires are connected.

Voltage-Plug Selection and Fuses

The power supply in your game contains six fuses. When you replace a fuse, use the identical type fuse with the same electrical rating (see Figure 1-2).

This power supply operates on the line voltage of many countries. The power supply comes with either one, two, or three voltage-selection plugs. Plug voltages and wire colors are 100 VAC (violet wire color), 120 VAC (yellow wire color), 220 VAC (blue wire color), and 240 VAC (brown wire color).

See Figure 1-2 for placement of the voltage-selection plug. Before plugging in your game, check your line voltage. Next, check the wire color on the voltage-selection plug. Make sure the voltage-selection plug is correct for the line voltage of your location.

Now plug the game into a **grounded** 3-wire outlet.

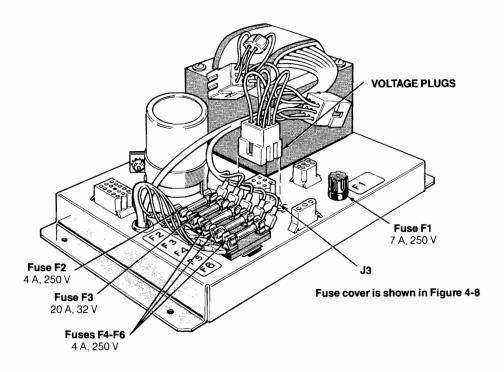

Figure 1-2 Voltage-Selection Plug and Fuse Locations

Major Havoc Set Up

Switch Locations

Power On/Off Switch

The power on/off switch is located on the back of the cabinet on the lower left side (see Figure 1-1).

Utility Panel Switches

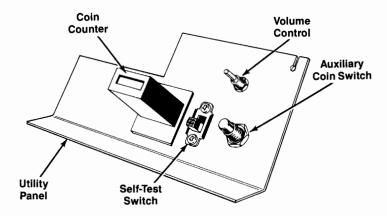

The volume control, coin counter(s), self-test switch, and auxiliary coin switch are on the utility panel. The utility panel is located inside the upper coin door (see Figure 1-1). The volume control adjusts the level of sound produced by the game. The coin counter(s) records the number of coins entered into the game. The self-test switch initiates

the self-test mode. The auxiliary coin switch credits the game without activating a coin counter. See Figures 1-3 and 4-5 for details of these switches.

Option Switches

Major Havoc has two option switches. Figure 1-3 shows the location of these dual-inline-package (DIP) switches on the game printed-circuit board (PCB).

- Option switch SW1 at 13/14S controls game play options.
- Option switch SW2 at 8S controls whether the coins are counted on 1 or 2 counters.

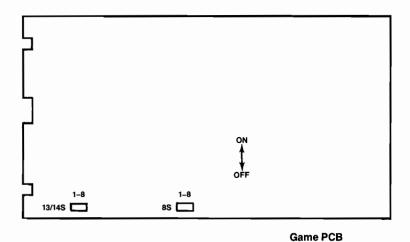

Figure 1-3 Switch Locations

Selecting the Coin, Credit, and Game Options

Settings for option switches are listed in Tables 1-2 and 1-3. Options preset at the factory are shown by the ◀ symbol; however, you may change settings according to your needs.

To verify other option selections, check the Operator Information Display that appears when you enter the Self-Test Mode. See Chapter 2 for details.

Self Test

This game will test itself and provide data to show that the game circuitry and controls are operating properly. Self-test data is presented visually on the video display and audibly through the speakers. No additional equipment is required.

We suggest you perform a self-test when you first set up, each time you collect money, change the game options, or suspect game failure.

Chapter 2

Self Test Major Havoc

Self-Test Displays

The self-test switch and the auxiliary coin switch are located on the utility panel inside the coin door. The option switches are on the game printed-circuit board (see Figure 1-3).

Enter the Self-Test Mode by turning on the self-test switch. When the self-test switch is turned on during Attract, Ready-to-Play, or Game Play Modes, the game will go to the Operator Information Display (see Screen 1 of Self-Test Mode), which also contains the gamma microprocessor display (see Figure 2-1).

Screen 1: Operator Information Display

This display shows the condition of the RAM and ROM for the gamma microprocessor. If there is a RAM or ROM failure, the display will identify the failed component and give its location. See Table 2-1 for the location of the failed gamma microprocessor component on the game PCB.

NOTE -

The following self-test displays are arranged in the sequence in which they occur after the selftest switch is set to the *on* position. Press the auxiliary coin switch to end each display and obtain the next display. If the self-test procedures are not performed in sequence, pressing the auxiliary coin switch will advance the game through the displays until the desired display is obtained. If the game is turned on with the self-test switch in the on position, the game will go directly to the Operator Information Display.

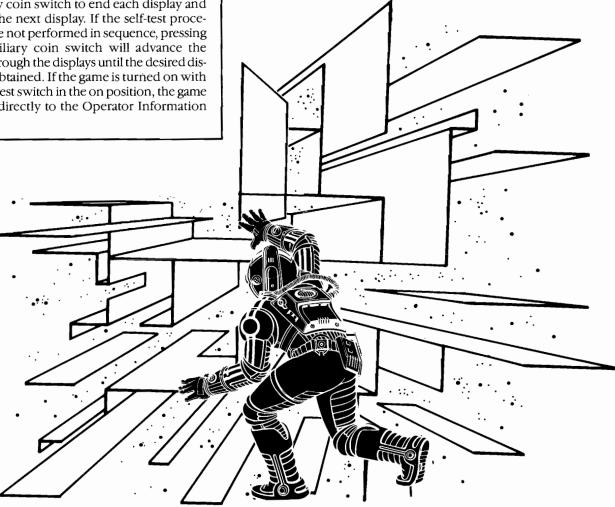

To return to the Attract Mode, turn off the self-test switch.

- NOTE

The game-reset circuitry must be operating or the game will lock up with a blank screen. If a locked condition occurs, turn the self-test switch off and turn the game off and back on. If the game does not restart after this action, troubleshooting of the game-reset circuitry may be necessary.

ROM Checksums

See Table 2-3 to determine the ROM location of a checksum error in the alpha microprocessor.

NOTE-

If the ROM checksum is correct, neither the self-test ROM identifier (a single character) nor the checksum (a double character) appears on the screen.

Screen 3: Scaling Test Display

A red outline frames the sides of the screen during this test. Inside this red outline a white box of decreasing size appears inside a white frame. The white box should shrink smoothly and disappear into the center indicator on the screen. If a sudden change in the size of the square occurs, an error may exist. This sequence will repeat indefinitely until you press the auxiliary coin switch. This pattern tests the binary and linear scaling circuitry.

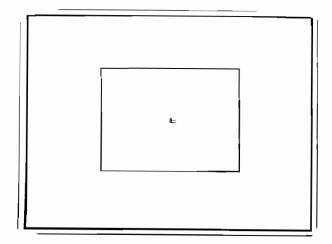

Figure 2-3 Screen 3: Scaling Test Display

Screen 4: Bipolar Offset Test Display

This procedure should be performed only after the game has been on for at least 15 minutes to ensure that the game PCB is fully warmed up.

Press the auxiliary coin switch to obtain the Bipolar Offset Test (BIP) Display as shown in Figure 2-4. The lines in the center of the screen should cleanly overlap to form a single orange square. If you see red and green lines, adjust the X and Y bipolar offset potentiometers as described on the Linear Scaling schematic diagram in the Schematic Package Supplement (SP-252). These potentiometers are designated XBIP (R80) and YBIP (R81). The upper right-hand corner of the orange square is the critical adjustment point.

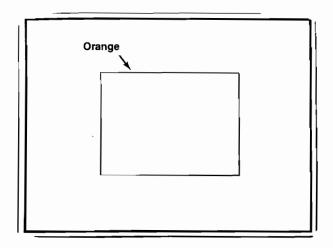

Figure 2-4 Screen 4: Bipolar Offset Test Display

Self Test Major Havoc

Screen 5: Crosshatch Pattern Display

Press the auxiliary coin switch to obtain the Crosshatch Pattern Display as shown in Figure 2-5. Verify the following display characteristics:

- All four corners of the red outline must be off the screen, while all four corners of the white outline are completely visible. If not, adjust potentiometers XSIZE (R34), YSIZE (R48), XCENTER (R39), and YCENTER (R55) as described on the X and Y Output schematic diagram in the Schematic Package Supplement (SP-252).
- A white frame filled with a crosshatch pattern appears inside the red outline.
- The crosshatch corners are closed and the diagonal lines form symmetrical diamond-shaped squares. These lines should be straight within %6-inch over their length (visually straight is satisfactory). If otherwise, adjust potentiometers XLINEARITY (R38) and YLINEARITY (R50) as described on the X and Y Output schematic diagram in the Schematic Package Supplement (SP-252).
- The crosshatch pattern is not tilted more than ¼-inch between corners.
- The pattern is a uniform white color.
- A line of alphanumeric characters stretches across the display.

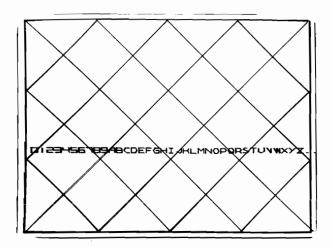

Figure 2-5 Screen 5: Crosshatch Pattern Display

Screen 6: Color Intensity Test Display

Press the auxiliary coin switch to obtain the Color Intensity Test Display as shown in Figure 2-6. Verify the following display characteristics:

- Top row of color bars red, blue, and green.
- All three sets of color bars have six lines dim at the top and increasing in intensity at the bottom.
- Bars underneath the top row of color bars are white.
- Bars underneath the white color are yellow, light blue, and purple.

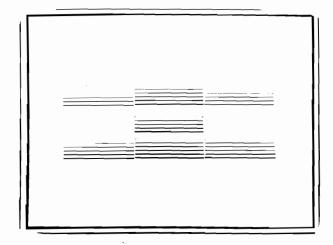

Figure 2-6 Screen 6: Color Intensity Test Display

This test checks the seven screen colors and six intensities of each color. If the intensities do not progress from dim at the top of each color group to bright at the bottom, there is a problem in the Z-axis of the game PCB or in the video display. If the colors are not as described, there is a problem with the red, green, or blue output of the game PCB or with the video display circuitry. Use this pattern for tracking adjustments and for brightness adjustment. Refer to the Color X-Y Display Manual for the brightness adjustment procedure or to determine the possible cause of failure.

Major Havoc Self Test

Screen 7: Color Intensity Test Display

Press the auxiliary coin switch to obtain the Color Intensity Test Display as shown in Figure 2-7. Sixteen intensities (15 visible and 1 with zero intensity) of each of 16 colors are displayed. One color is black, resulting in an empty column. Every location in the color RAM is used. Use this screen for vector generator and color RAM troubleshooting. Do not use it for adjustment or quality checking.

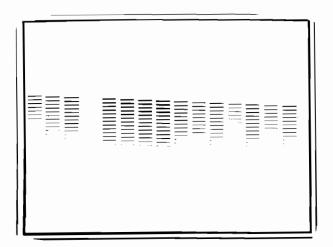

Figure 2-7 Screen 7: Color Intensity Test Display

Screen 8: Grid Pattern Display

Press the auxiliary coin switch to obtain the Grid Pattern Display outlined in red as shown in Figure 2-8. Use this display to check for proper convergence and color purity. The horizontal lines may or may not touch the right side of the square.

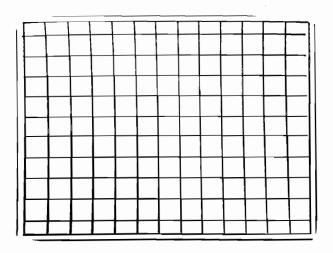

Figure 2-8 Screen 8: Grid Pattern Display

Maintenance

─ WARNING — **▲**

To avoid possible electrical shock hazard, unplug the game prior to performing any maintenance.

The maintenance procedures provided in this chapter are for those items which are subject to the most severe use. To assure the maximum trouble-free operation from this game, Atari recommends that periodic routine maintenance be performed on the game components described in the following procedures. How often routine maintenance is performed depends upon the game environment and frequency of play.

Maintenance Major Havoc

Cleaning Requirements

This game cabinet and the display shield may be cleaned with any non-abrasive household cleaner. A toothbrush may be used to remove any stubborn build-up of residue in the coin path, on the plastic roller, or drive and idler shafts of the roller control. Be sure to lubricate the shaft bearings after cleaning. Compressed air is also recommended for cleaning dust from the interior of the cabinet.

Opening the Control Panel

Perform the following procedure to open the control panel:

- 1. Unlock and open the coin door. Reach up through the coin-door opening to the top of the front panel and release the spring-draw latch (see Figure 3-1).
- 2. Close the coin door.
- Lift the front of the control panel by exerting upward pressure on both sides. Slide it forward and tilt it toward you.
- 4. Hook the control panel over the front of the cabinet using the bracket that is part of the black aluminum control-panel cap (see Figure 3-1).
- 5. Disconnect the control harness before moving the control panel to a work surface.

Pushbutton Leaf Switches

- 1. With the control panel open, adjust the leaf switch contacts for a narrow gap. Don't burnish the contacts. To clean them, use electrical contact cleaner.
- 2. To replace a leaf switch, remove the screw with a Phillips-head screwdriver.
- 3. To remove the switch pushbutton, turn the stamped nut with a wrench in a counterclockwise direction, as seen from the inside of the control panel. The ring on the outside of the control panel should not spin.
- 4. Reinstall the pushbutton switch. Reconnect the harness wires to the switch terminals as shown in Figure 3-1.

Removing the Roller-Control Assembly

Perform the following procedure to remove the roller control from the control panel:

 Open the control panel as previously described in this chapter and disconnect the wires from the lamp socket. Disconnect the harness at the four-pin connector on the coupler PCB assembly. 2. Remove the nuts and carriage bolts that secure the roller-control assembly to the control panel (see Figure 3-1).

Roller-Control Maintenance

Routine preventive maintenance of the roller-control assembly consists primarily of lubricating the shaft bearings and checking the mounting screws and washers for proper tightness approximately every four months. The roller-control assembly consists of a roller, a drive shaft, an idler shaft, upper and lower frames, and a coupler PCB assembly. Refer to Figure 3-2 for the location of the parts mentioned in the following procedures.

Routine Maintenance and Disassembly

- Open the control panel and remove the roller-control assembly as previously described in this chapter.
- 2. Use a Phillips-head screwdriver to remove the panhead screws that secure the upper and lower frames (see Figure 3-2).
- Carefully lift the upper frame straight up from the assembly.

CAUTION -

Be sure to keep the drive studs in the upper frame. They must be in place during reassembly or the roller will not function.

- Remove the plastic roller.
- Apply two drops of a light machine oil, such as 3-In-One oil, to the inside of the four shaft bearings. Wipe off any excess oil from the shafts.
- The contact area of the drive shaft may have dirt buildup from use. Remove the residue as previously described in this chapter under Cleaning Requirements.
- 7. Use the appropriate hex-head wrench to check the tightness of the socket-head screw that secures the encoding wheel to the drive shaft. Use a pin or small screwdriver to steady the shaft. Refer to Figure 3-2 for an illustration of the the shaft screw location.
- 8. Lift the idler shaft and bearings from the lower frame. Be careful not to lose the bearings.
- 9. Slide the bearings off each end of the idler shaft.
- 10. Wipe off any dirt build-up from the shaft with a soft clean cloth.
- 11. Lift the drive shaft with bearings and encoding wheel from the lower frame. Be careful not to lose the end bearing.

Major Havoc Maintenance

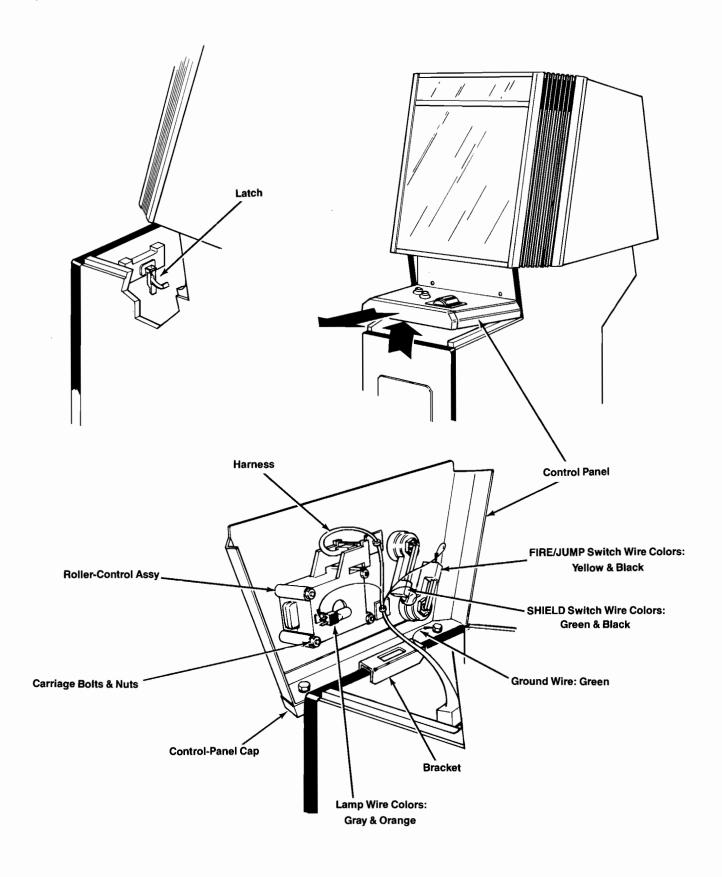

Figure 3-1 Control Panel Opening and Wire Colors

Maintenance Major Havoc

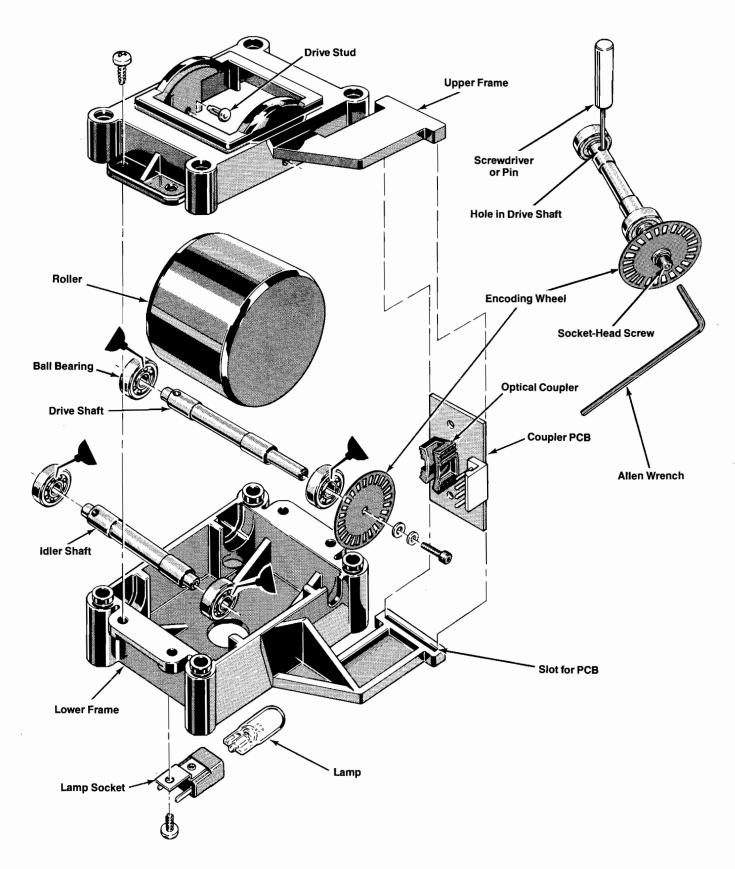

Figure 3-2 Roller-Control Assembly Lubrication and Adjustment

- 12. Remove the metal encoding wheel by loosening the socket-head screw with an Allen wrench. Be careful not to lose the two small washers and screw.
- 13. Gently slide the other bearing off the end of the drive shaft.
- 14. Wipe off any dirt build-up from the shaft with a soft clean cloth.
- 15. Reassemble the roller-control assembly as described in the following procedure.

Reassembling the Roller-Control Assembly

Perform the following procedure to reassemble the roller control (see Figure 3-2):

- 1. Remount the bearings, encoding wheel, washers, and socket-head screw on the drive shaft.
- 2. Reinstall the drive shaft in the lower frame.
- 3. Refer to Figure 3-2 and tighten the encoding wheel by inserting a %-inch diameter pin or screwdriver through the hole in the shaft. Tighten the socket-head screw with an Allen wrench.
- 4. Remount the bearings on each end of the idler shaft.
- 5. Reinstall the idler shaft in the lower frame.
- 6. Reinstall the plastic roller in the lower frame.
- 7. Reinstall the coupler PCB assembly in the lower frame.
- 8. Position the upper frame over the lower frame so the four screw holes are aligned and the coupler PCB assembly is secured.

- CAUTION -

Be sure to keep the drive studs in the upper frame. They must be in place during reassembly or the roller will not function.

9. Use a Phillips-head screwdriver to tighten the four screws securing the upper and lower frames to each other.

- 10. Reinstall the roller-control assembly in the control panel using the nuts and carriage bolts.
- 11. Reconnect the control harness.
- 12. Reconnect the wires to the lamp socket.

Replacing the Coupler PCB Assembly

To replace the coupler PCB assembly after the roller-control assembly has been removed from the control panel and disassembled, perform the following procedure (see Figure 3-2):

- 1. Disconnect the four-pin connector and lift the coupler PCB assembly from its slot.
- To reinstall the coupler PCB assembly, place the PCB in the slot in the lower frame and reconnect the fourpin connector.

- CAUTION -

When you reinstall the coupler PCB assembly, make sure that the metal encoding wheel is not bent or damaged. Be sure the encoding wheel turns freely between the two halves of the radial optical coupler.

Light and Speaker Board Assembly

Removing the Light and Speaker Board Assembly

Perform the following procedure to remove the light and speaker board assembly from the game (see Figure 3-3):

1. Remove the screws from the rear access panel of the game cabinet with a Phillips-head screwdriver.

Maintenance Major Havoc

2. Disconnect the harnesses from the fluorescent light assembly and from the speakers.

- From the front of the cabinet, use an Allen wrench to remove the screws from the attraction shield upper retainer.
- 4. Slide both the attraction shield and the semi-rigid film that is behind the shield up and out of the extruded metal speaker grilles.

- NOTE -

A plastic U-shaped molding is firmly fitted on each side of the attraction shield and on each side of the display shield. These moldings should stay on when you remove the shields.

- Remove the H-shaped retainer between the attraction shield and the display shield.
- Slide the display shield up and out of the extruded metal speaker grilles.
- 7. Carefully remove the display bezel.
- Remove the screws securing the extruded metal speaker grilles to the cabinet walls on both sides of the video display.
- Remove the screws securing the light-and-speakerboard cleat to the display shelf at the top of the display.
- 10. From the back of the cabinet, remove the screws securing the light and speaker board to the side cleats.
- Pull the fluorescent light and speaker board assembly out of the front of the cabinet.

Speaker Replacement

To replace either of the speakers attached to the light and speaker board, you must first remove the fluorescent light and speaker board assembly from the game cabinet (see Figure 3-3).

Perform the following procedure to replace a speaker:

- Remove the fluorescent light and speaker board assembly as previously described.
- With the fluorescent light and speaker board assembly out of the cabinet, disconnect the two snap-on connectors from each speaker.
- 3. Remove the hardware securing each speaker to its mounting grille/bracket.
- Mount each new speaker to its mounting grille/bracket with the appropriate hardware.
- Reconnect the snap-on connectors to each speaker. The white wire connects to the positive (+) terminal on the left speaker. The brown wire goes on the negative (unmarked) terminal on the right speaker (see the wiring diagram in SP-252).

NOTE -

The positive terminal on the speaker is marked with either a plus sign (+) or a painted red dot.

Reinstalling the Fluorescent Light and Speaker Board Assembly

- Carefully slide the fluorescent light and speaker board assembly into the upper front of the cabinet.
- Replace the screws securing the light-and-speaker-board cleat to the display shelf at the top of the display.
- From the back of the cabinet, replace the screws securing the light and speaker board to the side cleats.
- From the front of the cabinet, reinstall the extruded metal speaker grilles on both sides of the video display with the appropriate hardware.
- Slide the bottom edge of the video-display bezel into the retaining slot at the bottom of the cabinet head. Position the remaining three sides of the bezel in place around the video display.
- Replace the video display shield (with the plastic moldings attached) by sliding the bottom edge into the slots of the extruded metal speaker grilles on either side of the video display.
- Slide the attraction panel (with the plastic moldings attached) and semi-rigid film into the speaker grilles in front of the fluorescent light and speaker board assembly.
- Use an Allen wrench to replace the hardware that secures the attraction shield upper retainer to the cabinet.
- From the back of the cabinet, reconnect the 3-pin connector to the fluorescent light harness and the 2-pin connector to each speaker.
- 10. Use a Phillips-head screwdriver to replace the hardware that secures the upper access panel to the cabinet.

- CAUTION -

This speaker is held by wedge only at the top. When reinstalling, slide the top of the speaker into the wedge before centering it over the panel opening and replacing the screws.

Lower Speaker

Access to the lower speaker is from inside the back of the cabinet (see Figure 3-3). Disconnect the speaker harness and the two snap-on connectors. Remove the screws securing the speaker to the speaker panel.

The lower speaker grille may be removed from the front of the cabinet only with a square-drive screwdriver. The grille should be considered permanently installed. Major Havoc Maintenance

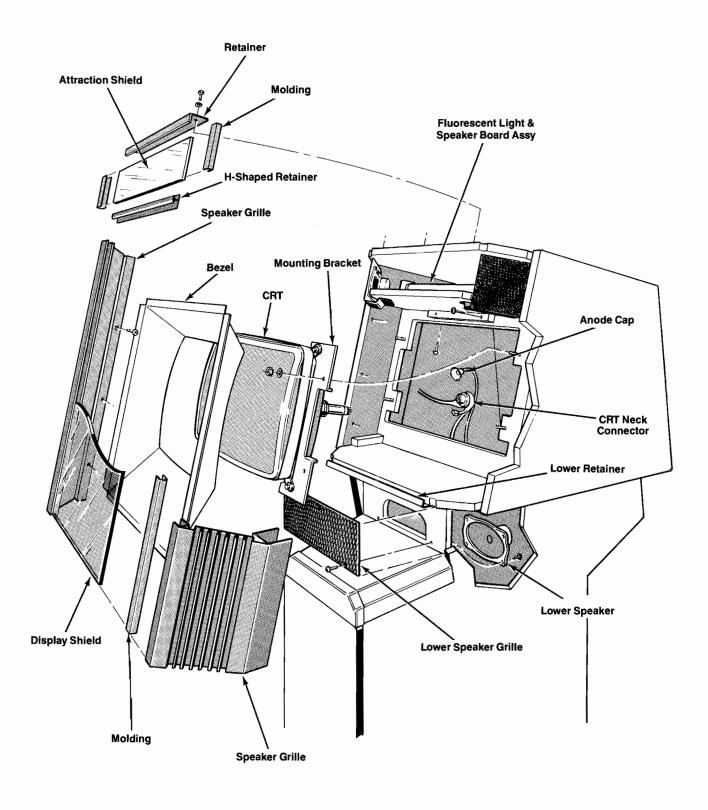

Figure 3-3 Fluorescent Light and Speaker Board Removal, Display Access

Maintenance Major Havoc

Removing the CRT Assembly

This display contains high voltages capable of delivering lethal quantities of energy. To avoid danger, do not attempt to service the display until you have observed all precautions necessary for working on high-voltage equipment.

X-Radiation

This display has been designed for minimum X-radiation hazard. However, to avoid possible exposure to soft X-radiation, never modify the high-voltage circuitry.

Implosion Hazard

The cathode-ray tube assembly may implode if struck or dropped. Shattered glass may cause personal injury within a 6-foot radius. To reduce the risks of injury to people or of damage to the game components, we recommend that two people perform the following removal procedures.

Perform the following procedure to remove the cathoderay tube (CRT) assembly from the game (see Figure 3-3):

- 1. Remove the rear access panel from the cabinet.
- 2. Discharge the high-voltage from the CRT before proceeding. The video display contains a circuit for discharging the CRT high voltage to ground when power is removed. However, to make certain, always discharge the CRT as follows:
 - a. Attach one end of a large, well insulated, 18-gauge jumper wire to ground.
 - Momentarily touch the free end of the grounded jumper to the anode by sliding it under the anode cap.

- c. Wait two minutes and repeat part b.
- 3. Disconnect the CRT neck-pin connector, anode lead, yoke connector, degaussing coil connector, and 1-pin DAG spring connector (see Figure 3-3).
- 4. Follow steps 1 through 8 under *Removing the Light* and *Speaker Board Assembly*.

- CAUTION -

Be extremely careful when removing the cathode-ray tube mounting bolts because the cathode-ray tube assembly can fall. We recommend that a second person **carefully** hold the cathode-ray-tube neck while the mounting bolts are being removed.

- Use a ¼-inch combination wrench to remove the bolts and washers from the front of the display mounting bracket.
- 6. Carefully lift the CRT assembly from the front of the cabinet.
- 7. Replace in reverse order.

- NOTE -

Whenever the cathode-ray tube is replaced, readjust the brightness, purity, and convergence as described in the display manual.

Wiring the Utility Panel Controls

Refer to Figure 3-4 for the proper wire connections when replacing the controls that are mounted on the utility panel.

Figure 3-4 Utility Panel Wire Colors will follow the above text. Be sure the warning is on the illus.

may receive an electrical shock if the utility panel is not properly grounded! After servicing any parts on the panel, make sure that the ground wire is firmly attached to the back of the coin counter.

Illustrated Parts Lists

This chapter provides information you need to order parts for your game. Common hardware (screws, nuts, washers, etc.) has been deleted from most of the parts lists. However, a parts list is included for the hardware to mount the printed-circuit boards (PCB) to the cabinet.

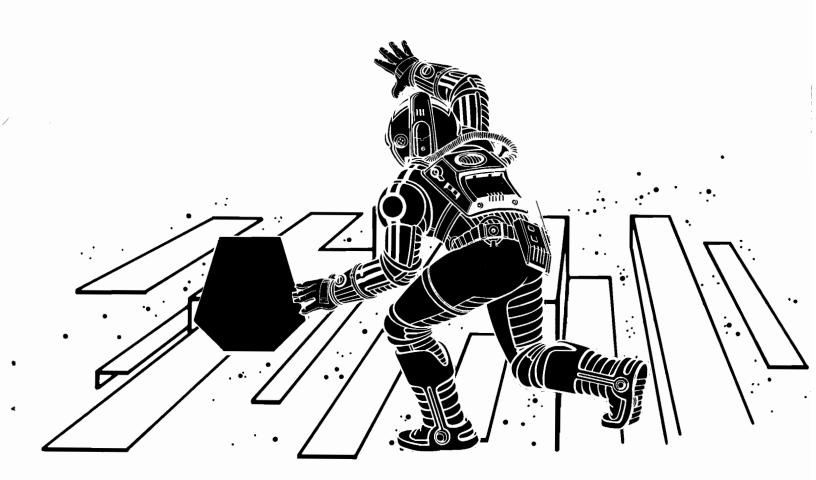

The PCB parts lists are arranged in alphabetical order by component. Each component subsection is arranged alphanumerically by reference designator.

Other parts lists are arranged alphanumerically by Atari part number. In these parts lists, all A-prefix numbers come

first. Following these are numbers in sequence evaluated up to the hyphen, namely 00- through 99-, then 000598-through approximately 201000-.

When ordering parts, please give the part number, part name, number of this manual, and serial number of your game. This will aid in filling your order rapidly and correctly. We hope the results will be less downtime and more profit from your game.

Atari Customer Service numbers are listed on the inside front cover of this manual.

Seller warrants that its printed-circuit boards and parts thereon are free from defects in material and workmanship under normal use and service for a period of ninety (90) days from date of shipment. Seller warrants that its video displays (in games supplied with displays) are free from defects in material and workmanship under normal use and service for a period of thirty (30) days from date of shipment. None of the Seller's other products or parts thereof are warranted.

If the products described in this manual fail to conform to this warranty, Sellers' sole liability shall be, at its option, to repair, replace, or credit Buyer's account for such products which are returned to Seller during said warranty period, provided:

- (a) Seller is promptly notified in writing upon discovery by Buyer that said products are defective;
- (b) Such products are returned prepaid to Sellers' plant; and
- (c) Seller's examination of said products discloses to Seller's satisfaction that such alleged defects existed and were not caused by accident, misuse, neglect, alteration, improper repair, installation or improper testing.

In no event shall Seller be liable for loss of profits, loss of use, incidental or consequential damages.

Except for any express warranty set forth in a written contract between Seller and Buyer which contract supersedes the terms of this order, this warranty is expressed in lieu of all other warranties expressed or implied, including the implied warranties of merchantability and fitness for a particular purpose, and of all other obligations or liabilities on the Seller's part, and it neither assumes nor authorizes any other person to assume for the Seller any other liabilities in connection with the sale of products under this order.

The use of any non-Atari parts may void your warranty, according to the terms of the warranty. The use of any non-Atari parts may also adversely affect the safety of your game and cause injury to yourself and others. Be very cautious in using non-Atari-supplied components with our games, in order to insure your safety.

Atari distributors are independent, being privately owned and operated. In their judgment they may sell parts or accessories other than Atari parts or accessories. Atari cannot be responsible for the quality, suitability or safety of any non-Atari part or any modification including labor which is performed by such distributor.
