

Joystick Circuitry

Option Input Circuitry

Testing the Option Switches

1. Perform the CAT Box preliminary set-up.
2. Set the CAT Box switches as follows:
 - a. DBUS SOURCE to DATA
 - b. BYTES to 1
 - c. R/W to READ
 - d. Key in address 0800 (N9) or 0801 (N8)
 - e. R/W MODE to CONTINUOUS
3. Activate the switch while monitoring the DATA DISPLAY. The DATA DISPLAY will change if the switch is operating properly.

Player Input Circuitry

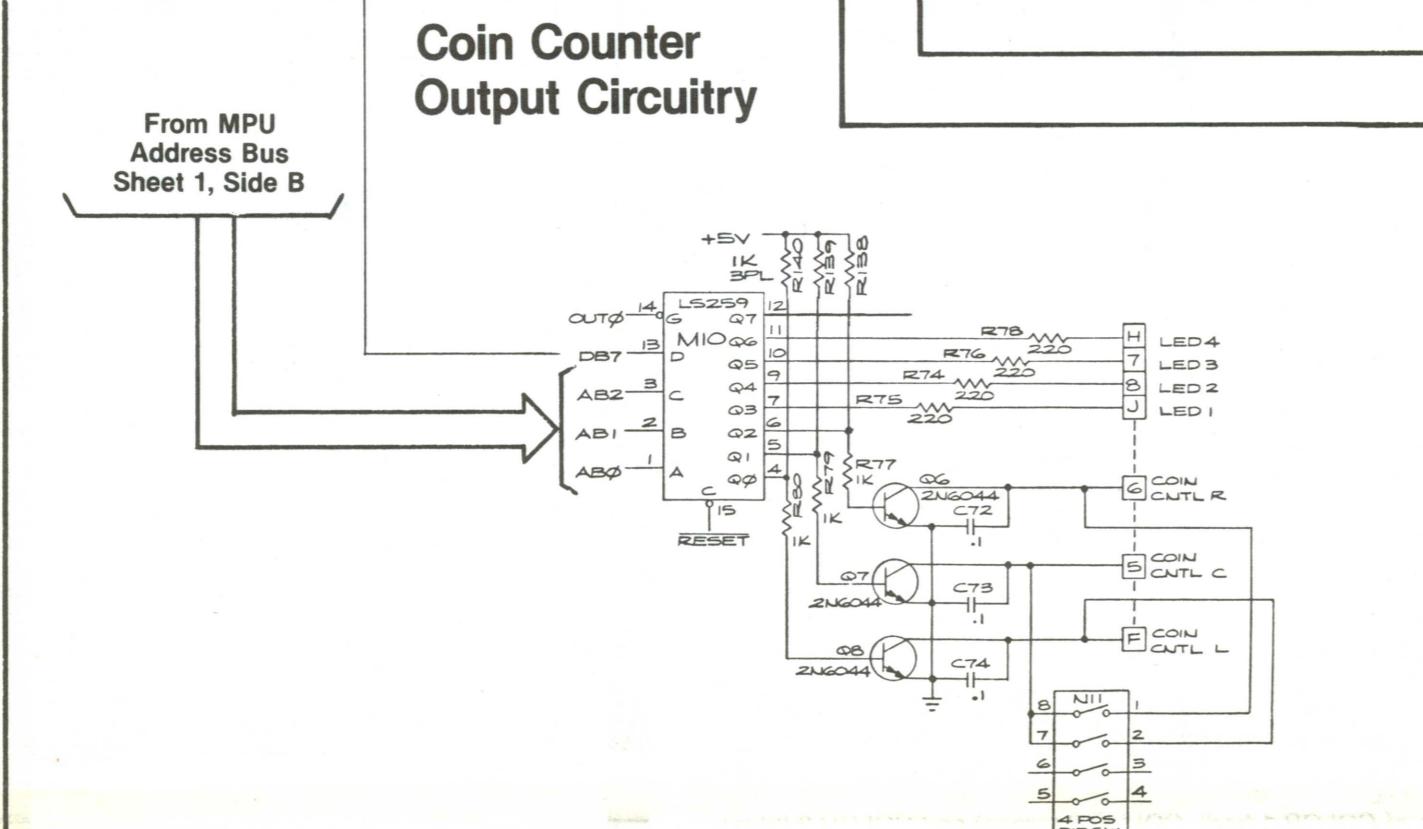

Testing the Player Inputs

1. Perform the CAT Box Preliminary Set-up.
2. Set the CAT Box switches as follows:
 - a. DBUS SOURCE to DATA
 - b. BYTES to 1
 - c. R/W to READ
 - d. Key in address 0C00 (self test switch only) or 0C01 (all others)
 - e. Press DATA SET
 - f. Key in data
 - g. R/W MODE to SINGLE
3. Activate the following player input switches, one at a time, while monitoring the DATA DISPLAY:
 - a. Coin Right
 - b. Coin Left
 - c. SLAM
 - d. FIRE
 - e. START 1
 - f. START 2
4. The DATA DISPLAY will change if the switches are operating properly.

Denotes a test point

Coin Counter Output Circuitry

Coin Counter Output Circuit

This circuit consists of coin counter drivers Q6, Q7, and Q8 and data latch M10. The circuit is addressed by the MPU on AB0-AB2 and written by the MPU on data line DB7. When the input to a driver is clocked high, its collector goes low grounding the return of the coin counter in the coin door.

High Score Memory Circuitry

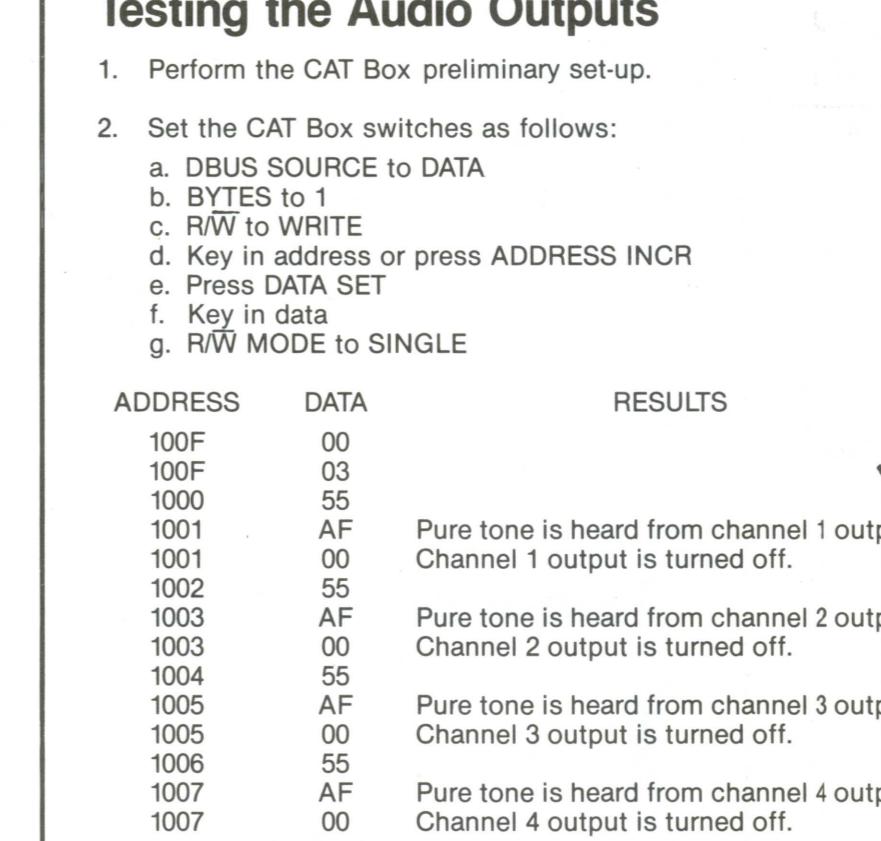

The High Score Memory circuit stores the three best scores and other pertinent information. These scores are saved even if power is removed from the game. The High Score Memory circuit consists of an erasable reprogrammable ROM E5, latches E4, H4, J4, buffer H5 and timer A11.

A11 produces a 0-15V square wave at a 1V rate. This signal, when +15V, forward biases diode CR5 and allows capacitor C86 to charge to -29V. When the signal is 0V, CR5 is cutoff and CR4 is forward-biased which causes C84 to develop a charge. C84 charges to approximately -28V. This is the potential required for EROM C0 to operate.

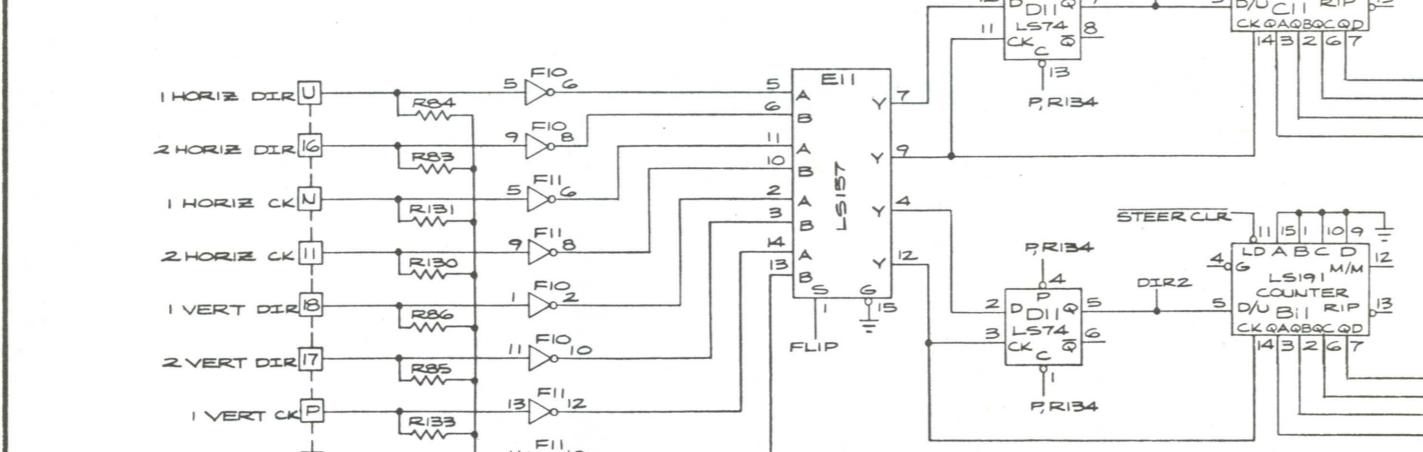

The MPU addresses the EROM (AB0-AB5) when a low EAADDR gates WRIT2 at gate A4. The trailing edge of the gated pulse latches the address information to the EROM via J4. Data is latched by H4 at the same time. The EROM mode (read, write or erase) is determined by DB0-DB3 at latch E4. A low EACONTROL gates WRIT2 at gate A4. The trailing edge of this gated pulse latches the data into the EROM E5 via latch H4.

Data is read from the EROM when EAREAD on pin 1 of buffer H4 goes low.

Audio Output Circuitry

Trak Ball™ Circuitry

Testing the Trak Ball™ Inputs

1. Perform the CAT Box Preliminary Set-up.
2. Set the CAT Box switches as follows:
 - a. DBUS SOURCE to DATA
 - b. BYTES to 1
 - c. R/W to READ
 - d. Key in address 0C00 (vertical) or 0C02 (horizontal)
 - e. R/W MODE to CONTINUOUS
3. Spin the TRAK Ball™ while monitoring the DATA DISPLAY. The DATA DISPLAY will change if the TRAK Ball input is operating properly.
