# **19" RASTER MONITOR TYPE A**

## **NOTES**

---

# **THIS MANUAL APPLIES TO THOSE MONITORS WITH SERIAL NUMBERS OF 576001 AND ABOVE.**

## **WARNINGS**

### **1. Power Up Warning—**

An isolation transformer must be used between the AC supply and the AC plug of the monitor before servicing or testing is performed since the chassis and the heat sink are directly connected to one side of the AC line which could present a shock hazard.

Before servicing is performed, read all the precautions labelled on the CRT and chassis.

### **2. X-RAY RADIATION WARNING NOTICE**

**WARNING:** PARTS WHICH INFLUENCE X-RAY RADIATION IN HORIZONTAL DEFLECTION, HIGH VOLTAGE CIRCUITS AND PICTURE TUBE ETC. ARE INDICATED BY (★) IN THE PARTS LIST FOR REPLACEMENT PURPOSES. USE ONLY THE TYPE SHOWN IN THE PARTS LIST.

### **3. High Voltage—**

This monitor contains HIGH VOLTAGES derived from power supplies capable of delivering LETHAL quantities of energy. Do not attempt to service until all precautions necessary for working on HIGH VOLTAGE equipment have been observed.

### **4. CRT Handling—**

Care must be taken not to bump or scratch the picture tube as this may cause the picture tube to implode resulting in personal injury. Shatter proof goggles must be worn when handling the CRT. High voltage must be completely discharged before handling. Do not handle the CRT by the neck.

### **5. PRODUCT SAFETY NOTICE**

**WARNING:** FOR CONTINUED SAFETY REPLACE SAFETY CRITICAL COMPONENTS ONLY WITH MANUFACTURER RECOMMENDED PARTS. THESE PARTS ARE IDENTIFIED BY SHADING AND BY (△) ON THE SCHEMATIC DIAGRAM.

**AVERTISSEMENT:** POUR MAINTENIR LE DEGRE DE SECURITE DE L'APPAREIL NE REMPLACER LES COMPOSANTS DONT LE FONCTIONNEMENT EST CRITIQUE POUR LA SECURITE QUE PAR DES PIECES RECOMMANDÉES PAR LE FABRICANT.

For replacement purposes, use the same type or specified type of wire and cable, assuring the positioning of the wires is followed (especially for H.V. and power supply circuits). Use of alternative wiring or positioning could result in damage to the monitor or in a shock or fire hazard.

## **PERFORMANCE AND OPERATING DATA**

1. Apply a suitable power source to the monitor through an isolation transformer.

2. Apply a suitable signal source to the monitor PCB by means of P201 and P202

3. Set Up Controls.

All controls are preset at the factory, but may be adjusted to suit program material.

### **1.0 Supply**

Voltage                    108 VAC-132 VAC

Frequency                50 Hz-60 Hz

Note: Apply supply voltage through an isolation transformer with 1 Amp. minimum capability.

### **2.0 High Voltage (EHT)**

For 19"V models             $24.3 \pm 0.8$  K.V. at 0 Beam;             $22.8 \pm 0.8$  K.V. at 1 mA Beam

Note: Condition for above: A.C. = 120V

### **3.0 Service Set-Up Controls**

#### **MAIN PC BOARD**

- 3.1 Vertical Hold Control, VR301
- 3.2 Vertical Size Control, VR303
- 3.3 Horizontal Hold Control, VR351
- 3.4 Vertical Raster Position Control, VR 901
- 3.5 Horizontal Raster Position Adjustment Jumper (3 positions)
- 3.6 Screen Control (Part of H.V. Unit, T352)
- 3.7 Focus Control (Part of H.V. Unit, T352)
- 3.8 Horizontal Width Coil, L352  
(L601 on Model K4904)
- 3.9 Black Level Control, VR201

- 3.10 Horizontal Video Position Control,  
(Horizontal Shift) VR352
- 3.11 Vertical Damping Control, VR302

#### **NECK PC BOARD**

- 3.12 Video Drive Controls, Red VR401  
Green VR402
- 3.13 CRT Cut Off Controls, Red VR403  
Green VR404  
Blue VR405

## SERVICE INSTRUCTIONS

**NOTE:** All monitors are equipped with automatic degaussing coils (L701) which demagnetize the picture tube every time the monitor is turned on after being off for a minimum of 5 minutes. Should any part of the chassis become magnetized it will be necessary to degauss the affected area with a manual degaussing coil. Move the coil slowly around the CRT face area and all surrounding metal parts. Then slowly withdraw for a distance of 6 feet before turning off.

### Horizontal vs. Vertical:

Some models have the picture tube mounted vertically rather than horizontally. That is, the picture tube is mounted in the frame such that the long dimension of the tube is up and down. Examples of this include (but are not limited to) Models K4951, K4952, K4956, K4956R, and K4961 as in the pictures on the bottom of the front cover. Other than the physical orientation of the picture tube, there is no electrical difference between these models and their horizontal counterparts. The same circuits, the vertical circuits, produce and control deflection along the short dimension of the tube in all models.

The same circuits, the horizontal circuits, produce and control deflection along the long dimension of the tube in all models. Therefore, wherever "vertical" appears in this manual or on the monitor, it refers to the short dimension of the picture tube; wherever "horizontal" appears, it refers to the long dimension of the picture tube.

### BLACK LEVEL CONTROL ADJUSTMENT

This control has been set at the factory and should not need further attention. However, when the game is connected a slight adjustment of VR201 may be necessary to obtain the proper black level (the black portion of the picture just extinguished).

### VERTICAL SIZE (HEIGHT)

Location of this control is shown in Fig. 1. This control must be adjusted slowly, if necessary, until the picture or test pattern attains the correct vertical proportions.

**NOTE:** This adjustment interacts with the vertical damping adjustment described in the paragraph below. It may be necessary to readjust the vertical size after the vertical damping control has been adjusted.

### VERTICAL DAMPING

Adjustment of this control is required only if the monitor is being used with a game in which the top several raster lines are visible on the screen. Adjust the vertical damping control for uniform spacing of the top raster lines.

### CIRCUIT PROTECTION

A 4.0A pigtail fuse, mounted on the Main Board has been provided to protect the Power Output Circuit.

### FOCUS

Adjust the Focus control, located on the HV unit (T352), for maximum over-all definition and fine picture detail.

### HORIZONTAL HOLD CONTROL ADJUSTMENT, VR351 (See Fig. 1a or 1b)

A warm-up period of at least five minutes should be allowed before alignment is carried out. With the monitor being driven from the game signal, short TP601 to TP31. Adjust VR351 until the picture stops sliding horizontally. Remove the short.

### HORIZONTAL VIDEO POSITION

If the video is off center on the raster, some compensation can be made by adjusting this control.

### VERTICAL RASTER POSITION ADJUSTMENT

If the video is off center vertically, (short dimension of picture tube) some compensation can be made by turning the vertical raster position control.

### HORIZONTAL RASTER POSITION ADJUSTMENT

If the video is off center horizontally (long dimension of the picture tube), some compensation can be made by moving the horizontal raster position adjustment jumper to either positions "R" or "L".

**NOTE:** This adjustment is not provided on Model K4903.

### HORIZONTAL WIDTH ADJUSTMENT

The horizontal width coil is a hexagonal tuning tool adjustment. This control must be adjusted slowly, if necessary, until the picture or test pattern attains the correct horizontal proportions.

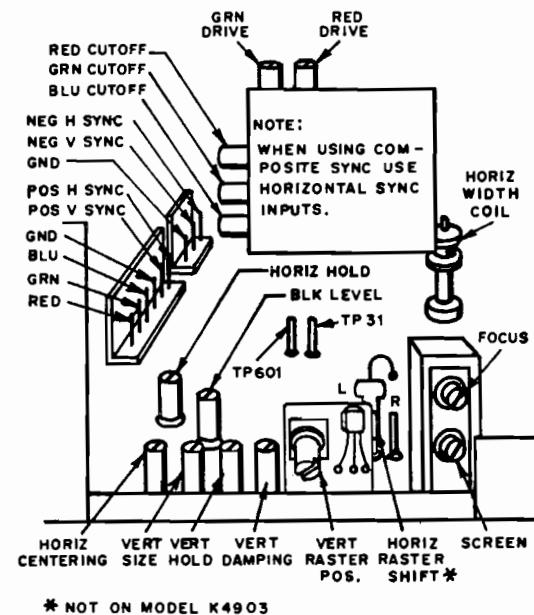

Figure 1(a)

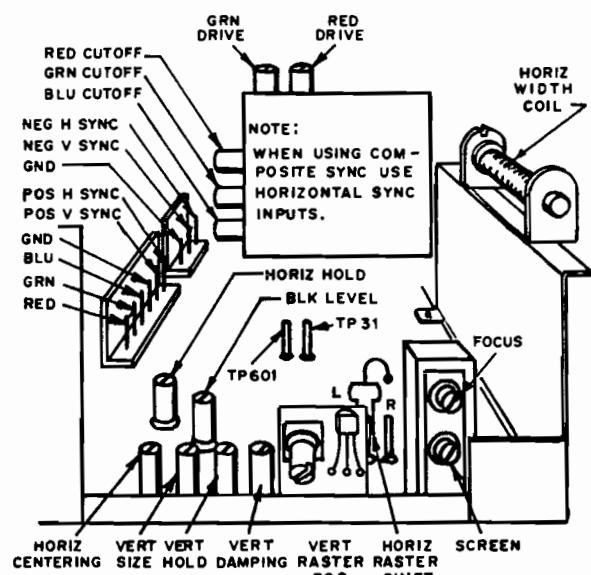

Figure 1(b)

## INSTALLATION INSTRUCTIONS

**NOTE:** All of the following procedures have been performed at the factory and should require no further attention. If the monitor is serviced for any reason, it should be observed afterward to determine whether any of these procedures need to be performed again.

### DEGAUSSING

The monitor is equipped with an automatic degaussing circuit. However, if the CRT shadow mask has become excessively magnetized, it may be necessary to degauss it with a manual coil. Do not switch the coil OFF while the raster shows any effect from the coil.

### WHITE BALANCE

- 1 Equipment Required: An oscilloscope with a DC coupled mode in the vertical amplifier, or a digital multimeter, or a VOM with a DC input impedance of at least 20,000 ohms/volt.
- 2 Referring to Fig. 1(a) or 1(b) and 3, do the following adjustments in subdued light after degaussing and setting the purity of the CRT.
- 3 Ground the R/G/B video inputs.
- 4 Set the Red and Green drive controls, VR401 and VR402, to approximately 80% of full CW rotation.
- 5 Set the screen and R/G/B cutoff controls to their minimum (fully CCW) positions.
- 6 Connect the oscilloscope, multimeter, or VOM, to the collector of a video output transistor (Q401, Q402, or Q403) on the CRT neck PCB at TP47R, TP47G, or TP47B as shown in Fig. 2.
- 7 Adjust the black level control (VR201) to obtain the waveform shown in Fig. 3 or a  $\pm 150$  volt DC reading on the multimeter or the VOM.
- 8 Slowly turn the screen control CW until the raster is just visible. The color of this raster is called the lead color gun. DO NOT adjust its associated cutoff control. It must remain fully CCW.
- 9 Adjust the screen control CCW until the raster is just extinguished. Then adjust the black level control for a dim raster.

- 10 Adjust the two remaining cutoff controls (NOT the lead color gun cutoff control) for best gray uniformity.
- 11 Adjust the black level control for a bright raster but not maximum brightness. Adjust the R/G drive controls, if necessary, for best neutral white.
- 12 Repeat steps 10 and 11 until good tracking of white balance is achieved.
- 13 With the oscilloscope, multimeter, or VOM connected to the collector of the lead color video output transistor (See Fig. 2), adjust the black level control to obtain the waveform in Fig. 3 or a  $\pm 150$  volt DC reading on the multimeter or VOM.

**REPLACEMENT PARTS LIST**  
**PART-ORDERING PHONE NO.: (312) 252-8220**  
**(WELLS-GARDNER MONITORS ONLY)**

This monitor contains circuits and components included specifically for safety purposes.

For continued protection no changes should be made to the original design, and components shown in shaded areas of schematic or  $\Delta\star$  on parts list should be replaced with exact factory replacement parts.

The use of substitute parts may create a shock, fire, radiation or other hazard. Service should be performed by qualified personnel only.

## OSCILLOSCOPE WAVEFORM PATTERN

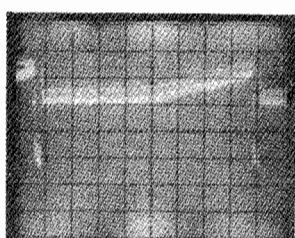

The waveforms shown are as observed on the wide band oscilloscope with the monitor turned to a reasonably strong signal and a normal picture. The voltages shown on each waveform are the approximate peak amplitudes. If the waveforms are observed on the oscilloscope with a poor high frequency response, the corner of the pulses will tend to more rounded than those shown and the amplitude of any high frequency pulse will tend to be less.

**19" RASTER  
MONITOR  
TYPE C**

# WARNINGS

---

The chassis and heat sinks are connected to ground. When measuring voltages, connect the negative terminal of the measuring instrument to the chassis.

- **X-RAYS**

This monitor is designed for minimum X-radiation. A special safety circuit guarantees that even in the event of failure, radiation will never exceed 0.5mR/h. For this reason **NEVER** alter the CRT circuit in any way.

- **EHV**

This monitor contains high voltages capable of delivering **LETHAL** amounts of energy. Avoid harm to the operator; follow precautions set down for the servicing of EHV equipment.

- **CRT**

The cathode-ray tube is a high-vacuum component and its surfaces are subjected to strong exterior pressure. Take care not to knock or scratch the tube as this could cause its implosion, resulting in personal injury and property damage. Installation personnel must use safety glasses and clothing protective against flying splinters.

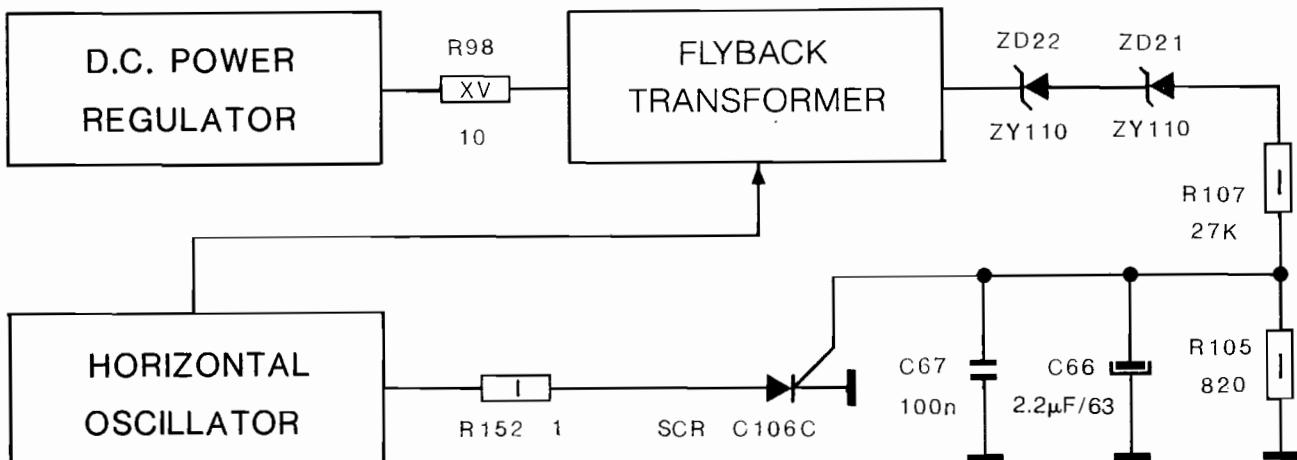

- **SHOCK**

To prevent the possibility of electrical discharges do not expose the monitor to rain or humidity.

## X-RAY PROTECTION

---

(patent no. 91830158.4)

This monitor incorporates a special circuit to eliminate radiation exceeding the legal limit of 0.5mR/h.

A 200V reference voltage (taken from the secondary of the flyback transformer) is fed via a resistive voltage divider to the gate of an SCR. Should component failure cause the EHV to rise above 26.5kV the reference voltage will increase sufficiently to fire the SCR. The SCR then shunts horizontal oscillator Vcc to ground through a current-limiting resistor, thus preventing generation of EHV. The SCR circuit will shut off EHV before it rises to 27kV. At this point, X-radiation is only 0.15mR/h. The horizontal oscillator is disabled until the breakdown has been repaired and the supply reset.

# SETUP PROCEDURE

## **INSTRUMENTS REQUIRED**

- Digital multimeter with input impedance of 10M • Oscilloscope with a bandwidth of 10MHz•10/1 probe attenuator

Turn on the monitor and let the circuitry heat up for about 5 minutes. Then adjust the controls for an acceptable image. Next align the chassis according to the following instructions.

### **□ POWER SUPPLY WITHOUT SIGNAL**

Variable resistor RV 12 adjusts the **supply voltage** and requires adjustment only following repair. Proceed as follows:

- a) turn **brightness grid** control all the way counterclockwise.
- b) connect digital voltmeter to SP20 and adjust RV12 to obtain 115VDC.

**CAUTION: Voltages greater or less than nominal impair the functioning of the monitor.**

### **□ RGB INPUT LEVELS** (signal: color bars)

Turn RV10 **brightness control** up all the way; checking voltage at R27, R28, R31, adjust input control RV1/RV2/RV3 (**contrast**) to obtain 0.6Vpp for each color.

### **□ RGB VIDEO OUTPUT** (signal: color bars)

- Adjust RV5, RV7 and RV9 on neckboard to obtain a **black level** of 140VDC at KG, KR and KB.
- Adjust RV4, RV6, RV8 for a gain of 50Vpp at KG, KR and KB.
- Adjust RV10 (**input brightness**) for a **black level** of 160VDC at KG, KR and KB.
- Adjust G2 to obtain CRT cutoff.

### **□ WHITE BALANCE** (no signal)

With RV10 adjusted to make a white background visible, correct the gray by means of RV5, RV7 and RV9.

### **□ HORIZONTAL OSCILLATOR** (signal: crosshatch)

Jumper TP7 to TP8. Adjust RV13 to obtain maximum horizontal stability. Then remove the jumper.

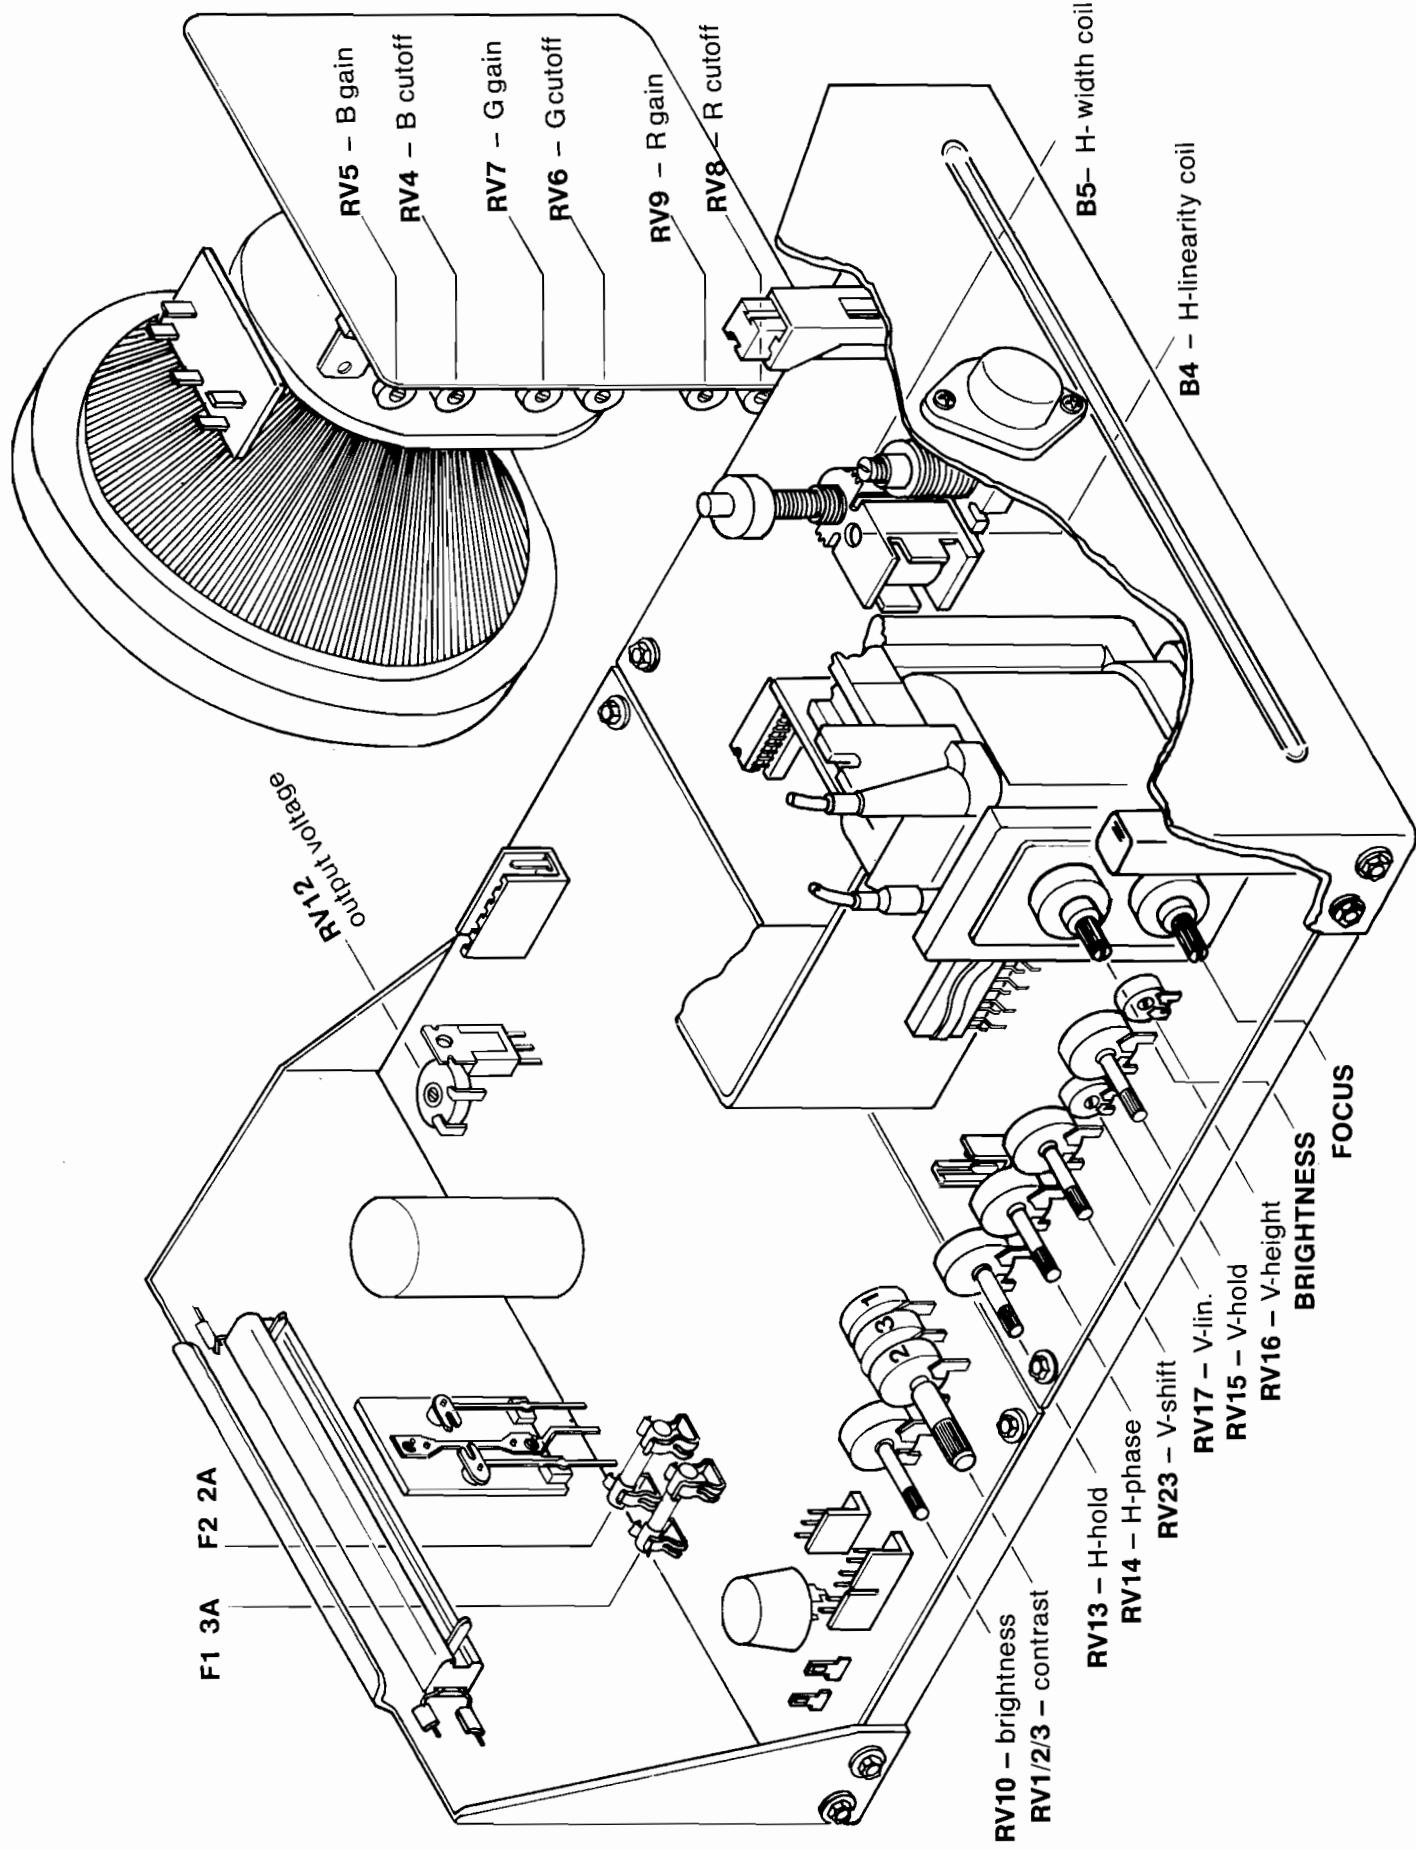

### **□ VERTICAL OSCILLATOR** (signal: crosshatch)

Adjust RV15 to obtain a slight downward rollover of the image. Then turn back slowly to eliminate rollover.

### **□ FOCUS** (signal: crosshatch)

Adjust **focus grid** control for clearest picture.

## ADJUSTMENT CONTROLS

# PERFORMANCE AND OPERATING DATA

---

		min	max
<b>1) PRIMARY (HV) VOLTAGE SUPPLY</b>			
VOLTAGE .....	.....	98VAC	130VAC
FREQUENCY .....	.....	44Hz	65Hz

**WARNING: SHOCK HAZARD!** Apply supply voltage **ONLY** through an isolation transformer with 1.5A capability.

<b>2) EHV</b>			
for 19" models. ....	.....	22.5kV	25.5kV

NOTE: conditions for above:

$$\begin{aligned} I(\text{beam}) &= 0\text{mA} \\ \text{DC supply voltage} &= 1.15\text{VDC} \end{aligned}$$
