

Service Bulletin #29

To: Service Manager
From: Jim Gorman
Date: 7 May, 1991
Subject: Correct Wiring of Speakers
Game : Checkpoint & Teenage Mutant Ninja Turtles Samples

Symptom: The speakers will put out a buzzing, rasping distorted drawn-out sound, along with voices popping like they are trying to repeat themselves.

Solution: Follow the instructions listed below.

Speaker wiring is as follows:

Table with 3 columns: Wire Color, Polarity, and Speaker Location. Rows include Blk-Yel/Blk (Right Speaker), Red-Blk/Red-Wht (Left Speaker), Yel-Blk/Yel-Wht (Center Speaker), and Left/Right Lug (Any Speaker).

Polarity is determined on the speaker by looking at the speaker's back side with the lugs pointing up.
