- **Internal Frequency Compensation**

#### description

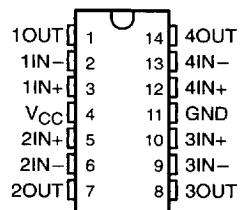

These devices consist of four independent high-gain frequency-compensated operational amplifiers that are designed specifically to operate from a single supply over a wide range of voltages. Operation from split supplies is also possible when the difference between the two supplies is 3 V to 30 V (for the LM2902 and LM2902Q, 3 V to 26 V) and  $V_{CC}$  is at least 1.5 V more positive than the input common-mode voltage. The low supply current drain is independent of the magnitude of the supply voltage.

Applications include transducer amplifiers, dc amplification blocks, and all the conventional operational amplifier circuits that now can be more easily implemented in single-supply-voltage systems. For example, the LM124 can be operated directly from the standard 5-V supply that is used in digital systems and easily provides the required interface electronics without requiring additional  $\pm 15\text{-V}$  supplies.

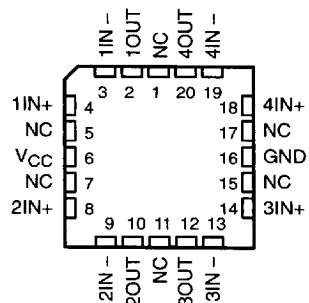

The LM2902Q is manufactured to demanding automotive requirements.

The LM124 and LM124A are characterized for operation over the full military temperature range of  $-55^\circ\text{C}$  to  $125^\circ\text{C}$ . The LM224 and LM224A are characterized for operation from  $-25^\circ\text{C}$  to  $85^\circ\text{C}$ . The LM324 and LM324A are characterized for operation from  $0^\circ\text{C}$  to  $70^\circ\text{C}$ . The LM2902 and LM2902Q are characterized for operation from  $-40^\circ\text{C}$  to  $125^\circ\text{C}$ .

**LM324Y chip information**

This chip, when properly assembled, displays characteristics similar to the LM324. Thermal compression or ultrasonic bonding may be used on the doped-aluminum bonding pads. Chips may be mounted with conductive epoxy or a gold-silicon preform.

Lead temperature 1.6 mm (1/16 inch) from case for 60 seconds	J or W package	300	300 ${}^\circ\text{C}$
Lead temperature 1.6 mm (1/16 inch) from case for 10 seconds	D, DB, N, or PW package	260	260 ${}^\circ\text{C}$

† Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. All voltage values (except differential voltages and  $V_{CC}$  specified for the measurement of  $I_{OS}$ ) are with respect to the network GND.  
2. Differential voltages are at  $\text{IN}^+$  with respect to  $\text{IN}^-$ .  
3. Short circuits from outputs to  $V_{CC}$  can cause excessive heating and eventual destruction.
